1 Purpose

Use this document to think through the next phase of Homage without needing to touch the app code. The current practical focus is the phone-first Document Studio experience.

2 Current Focus

2.1 Phone app

- Document Studio should be the primary active experience.
- Desktop/web preview is useful for development but not the product focus right now.

- Sky, music, and quest studio work is parked for later.

2.2 Local-first direction

- SQLite remains the canonical metadata and event store.
- Large generated assets can remain file-backed: PDFs, LaTeX, uploads, audio, and exported artifacts.
- Backend APIs should support local-first sync and publishing without making the app feel server-dependent.

3 Working Questions

3.1 Product

- Who is the first real user of Document Studio?
- What document should someone be able to make in under five minutes?
- What should feel magical on a phone instead of merely possible?
- What should be saved locally even when network access is unavailable?

3.2 Writing flow

- What are the minimum fields needed to publish a useful document?
- Should the app begin with a blank page, a guided prompt, or a reusable template?
- How much LaTeX control should be exposed to the user?
- What does "finished" mean: PDF, artifact, local library entry, shared drop, or all of these?

3.3 Technical

- Which document metadata belongs in SQLite?
- Which generated files belong on disk?
- What should the backend generate versus what the client can preview locally?
- What needs to work when the phone is remote over an Expo tunnel?

4 Proposed Milestones

4.1 TODO Milestone 1: Clarify the core document loop

- Open Document Studio on phone.
- Draft a document.
- Preview the design.
- Publish/generate a PDF.

- Save the result locally as an artifact.

4.2 TODO Milestone 2: Make the document library useful

- Browse previously generated documents.
- Reopen PDFs.
- Show saved source metadata.
- Make failures legible when backend or file access is unavailable.

4.3 TODO Milestone 3: Improve templates

- Define a small set of opinionated document styles.
- Decide whether templates are code-defined, database-defined, or file-defined.
- Add one template that feels specific to Homage rather than generic.

5 Decisions

Record decisions here as they become real.

Date	Decision	Reason

6 Parking Lot

Ideas that matter, but not today.

- Live sky lens
- Map quests
- Quest Studio
- Song Studio
- Multiplayer exploration
- Desktop-focused publishing tools

7 Notes

Write freely below this line.
